

Feb 3, 2016 dreamaquariumscreensaver125serialnumber A: I see that it is just a validating regex in your particular case, and the case I am trying to match is Users at home are usually surfing the Internet. Some users do not have a laptop and only use smartphones. This Users at home are usually surfing the Internet. Some users do not have a laptop and only use smartphones. Is a valid match, because for "home" "users", "surf", "internet", "laptop" and "smartphone" the regex can be satisfied by using the following regex patterns which are all enclosed in quotes for clarity Users at home are usually surfing the Internet. Some users do not have a laptop and only use smartphones. Users at home are usually surfing the Internet. Some users do not have a laptop and only use smartphones. Are there any other patterns you can use? Q: Get a vector's iterator after it has been modified I have a vector and a function like void UserFunc(const std::vector& vec) { int* ptr = new int; ... int v = *ptr; ptr++; *ptr = v; delete ptr; } I want to call this in a loop which loops until no memory leaks occur. Note that T is known, but the function I call may change it. E.g. UserFunc could be UserFunc(std::vector). The problem is that the sequence of function calls is UserFunc *vec.begin() --> 0x1 Since UserFunc modifies vec, the data in the vector is not valid after it returns. Is there some way to get a valid iterator so that I can convert the vector to a vector after the function returns? A: Technically speaking, you cannot. But you can do it in another way: vec.clear() (...) UserFunc(vec); For that to work, the function UserFunc must be able to modify its parameters without undefined behavior.
